Play Store readiness

Sri Charan Site Log · checks run against the real app on 11 October 2026

DONE = verified here · **ACTION** = needs something from you · **CHECK** = can only be confirmed on a real phone · **N/A** = does not apply. I could not test inside an installed Android app, in Play Console, or on your live Render settings.

Check	Status	What I found	What you do
Hosting & HTTPS	DONE	The app is served over HTTPS from Render.	—
Installable web app (manifest, icons, service worker)	DONE	Manifest has name, short name “SCC”, start page, standalone display, 192/512 icons and a maskable 512 icon. Installability audit: 26 of 26 pass; Lighthouse PWA score 100.	—
Opens when offline	DONE	Tested by genuinely stopping the server: the branded offline page appears with a Try again button (Android’s app shell needs this).	—
Quality scores (Lighthouse, sign-in page, phone)	DONE	Accessibility 100 · Best Practices 100 · SEO 100 · PWA 100 · Performance 82–96 (varies run to run; it was 0 before the fonts were hosted on your own site).	Re-run Lighthouse on your live address after deploying; real phones on a mobile network may differ.
Digital Asset Links (hides the browser bar in the app)	ACTION	/.well-known/assetlinks.json is now built from two server settings and is an empty list until you set them. Nothing is made up.	After Play Console shows your app-signing SHA-256 fingerprint, set on Render: ANDROID_PACKAGE_NAME and ANDROID_SHA256_CERT_FINGERPRINTS (see box below).
Privacy policy web address	DONE	Page exists and describes what the app really records: https://sri-charan-constructions.onrender.com/privacy.html	Enter this address in Play Console → App content → Privacy policy.
Support contact on the privacy page and footer	ACTION	Shown automatically once set. Nothing is displayed until then.	Set SUPPORT_EMAIL and SUPPORT_PHONE on Render. Play also needs a developer contact email in the listing.
Store graphics	DONE	Icon 512×512, feature graphic 1024×500 and six phone screenshots (1080×1920) are in this folder.	Optional: tablet screenshots (not required for a phone app).
App name and short name lengths	DONE	“Sri Charan Site Log” (19 characters; Play allows 30). Home-screen name “SCC”.	—
App access for Google’s reviewers	ACTION	The app needs a PIN, so reviewers cannot get in without one.	Create a Supervisor user called “Play Reviewer” with a PIN that is not obvious (1234 is refused), and enter it under App content → App access.
Account deletion rule	N/A	Applies to apps where people create accounts inside the app. Here only an Admin creates accounts.	State this in the form; deletion requests go to your support contact.
Permissions	CHECK	The app itself never asks for camera, location, contacts or microphone access; photos are chosen through the phone’s own picker. The Android wrapper is not built yet, so I cannot list what it adds by default.	After building, review the permissions the wrapper declares (it should need little beyond internet access), and on a real phone confirm “Add photo proof” opens the camera / gallery.
Files downloading inside the Android app	CHECK	Excel, PDF and document downloads work in Chrome and in the tests.	Cannot be verified here: on a real phone, inside the installed app, download one Excel, one PDF and one document.
Android Back button and external links	CHECK	—	On a real phone: Back should step through screens and leave the app from the first screen; the Privacy Policy link should open normally.

Check	Status	What I found	What you do
Target Android version	CHECK	Set by the wrapper tool (Bubblewrap / PWABuilder) when you build.	Use the newest version of the tool; Play Console states the minimum target at upload time.
Orientation	DONE	The manifest locks the app to portrait, which suits phones.	Remove “orientation” from the manifest if you ever want landscape on tablets.

Setting up the Android verification (one time, after your first Play upload)

1. In Play Console open **Setup** → **App signing** and copy the **SHA-256 certificate fingerprint** of the app-signing key (it looks like AA:BB:CC:… with 32 pairs).
2. On Render open your service → **Environment** and add:
   `ANDROID_PACKAGE_NAME` = the package name you chose (the app suggests com.sricharanconstructions.sitelog)
   `ANDROID_SHA256_CERT_FINGERPRINTS` = the fingerprint (several can be listed, separated by commas — add your upload key too if you test with it)
3. Save; Render restarts. Open `https://sri-charan-constructions.onrender.com/.well-known/assetlinks.json` and confirm it now lists your package and fingerprint.
4. Check it with Google's tester: digitalassetlinks.googleapis.com/v1/statements:list?source.web.site=https://sri-charan-constructions.onrender.com&relation=delegate_permission/common.handle_all_urls

Ready-to-paste store listing

App name (max 30)	Sri Charan Site Log
Short description (max 80)	Daily site entries, records, documents and payments for Sri Charan staff. [73 characters]
Full description (max 4000)	Sri Charan Site Log is the working tool for Sri Charan Constructions' own site staff. Supervisors record each day's vehicle and machine activity — readings, diesel, loads and where the loads were unloaded — with photo proof. The owner sees records, summaries by day, week or any date range, stored documents such as work orders and tax invoices, and weekly and monthly payment lists. Administrators manage vehicles, sites, operators and users, and every change is written to an activity log. Reports download as Excel or PDF. Sign in with the PIN your administrator gave you. The app is for authorised staff only and contains no advertising. [641 characters]
Category	Business

Data safety form — suggested answers (please review before you submit)

Does the app collect or share data?	Collects: yes. Shares with third parties: no. (Render and Supabase only host the data for you, as service providers.)
Data collected	Personal info: name · Photos: meter and diesel-slip photos · Files and docs: uploaded documents · Financial info: payment records for employees · App activity: actions recorded in the activity log · Device or other IDs: IP address and browser type in the activity log (declare it to be safe).
Why it is collected	App functionality and security / fraud prevention. Not for advertising, marketing or analytics.
Encrypted in transit?	Yes (HTTPS).
Can people ask for deletion?	Yes — through your support contact; an Administrator can delete users, entries, documents and payments.
Data is required or optional?	Required for the app to work (it is a business tool, not a consumer service).

Other forms: **Target audience** 18 and over · **Content rating** answer "No" to every content question (a work tool) · **Ads** none · **Government app / news / health / finance app** none. The privacy policy and these answers are my drafting from how the app behaves; have them read by someone who can give legal advice before you rely on them.
